BI TAD™
Promoting Accountability & Sobriety

BI TAD – transdermal alcohol detector – provides drug, DUI and DWI courts with an additional tool to monitor sobriety and promote accountability. Judges and court practitioners can use TAD in response to first-time alcohol offenses or as a sanction for repeat violators. The benefits of using TAD are two-fold – courts receive the data and validation they need while participant treatment efforts are supported through continued sobriety.

How TAD Works

TAD is worn on the ankle 24x7 and serves as a physical reminder of sobriety conditions while continuously sensing for alcohol through the skin. TAD generates a drinking event alert when a TAC (transdermal alcohol content) level of .020 or above is detected. Alerts are uploaded to the host computer through an in-home receiver and can be communicated via email, fax, or text message.

Curfew Monitoring Too

For courts seeking to monitor participant schedules, TAD also includes radio frequency curfew monitoring. Participant schedules can be configured to accommodate work, school or treatment appointments while also providing a structured routine to support rehabilitation.

Easy to Use & Secure

Because TAD is ankle-worn and easy to install, it removes the complexity associated with many hand-held breath alcohol testing devices. Client enrollment in the software is simple and doesn't require any initial client training, testing or participation. TAD includes seven sensors to detect tampers or attempts to compromise the system.
